

Register ActiveX Controls

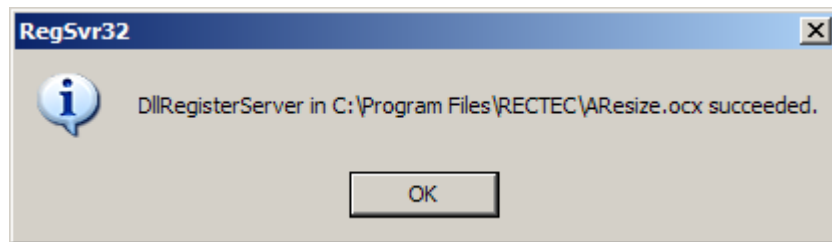

A Walkthrough

Registering an ActiveX Control is very simple. Once a control is registered, it will be recognized by the system. The first step is getting the path to the ActiveX Control. You can do this a number of ways, such as browsing to the control location and copying the path in the Explorer address bar, or searching for the file. For this example I am going to register the AResize.ocx control that is located in C:\Program Files\RECTEC on my machine.

Windows has a program called "regsvr32" that is used to register controls. To register a control, go to Start->Run and enter regsvr32 followed by the path and name of the control you want to register. Place the path in quotations. For example, to register the AResize.ocx control I would enter:

```
regsvr32 "C:\Program Files\RECTEC\AResize.ocx"
```

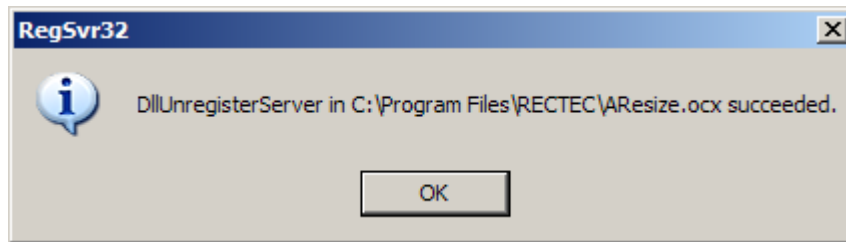

After pressing OK, you should see a message box saying it succeeded.

To un-register a control add "/u" after regsvr32. For example, to un-register the Aresize.ocx control I would enter:

```
regsvr32 /u "C:\Program Files\RECTEC\AResize.ocx"
```

After pressing OK, you should see a message box saying it succeeded.

To view a list of options for the regsvr32 program enter only "regsvr32" in the run box.
